

GROWER'S FACTS

W.H.PERRON 

B ean - shell

CULTURAL PRACTICES: sow the beans from mid-May to the end of July; make sure that the danger of frost on the ground has passed, as the seeds are fragile. To germinate, they need a ground temperature of at least 18 ° C, but no more than 24 ° C. Germination of seeds will be poor if they are planted too early or if the soil is too wet.

SOIL: it prefers light, well-drained soil.

SPACING: space the seeds 5 cm to 8 cm in rows 50 cm apart.

GROWING TIPS: As soon as the plants reach 25 cm high, mound them by bringing a little soil on the stems to keep them straight.

HARVEST: harvest them when the plants are dry and the grains ring in the pods. The dry grains are eaten in soups or baked beans.
