

# GROWER'S FACTS

W.H.PERRON 

## C CAULIFLOWER

**CULTURAL PRACTICES:** cauliflower, more than any other vegetable, is affected by climate and grows best in cool weather. For an early harvest, sow them in a greenhouse between early February and mid-March, the young seedlings must be hardened before transplanting them to the garden or sowing them in the ground as soon as the soil allows. For a fall harvest, sow cauliflower in open ground between early and mid-June.

**SOIL:** cauliflower prefers fertile soil and needs moisture. Plant them in full sun with light shade.

**SPACING:** plant them at a depth of 6 mm to 13 mm, as far apart as possible. When the seedlings are 10 cm high, thin out to 45 cm to 50 cm in rows spaced 60 cm to 90 cm apart.

**GROWING TIPS:** for varieties that do not have self-covering foliage, tie the foliage to cover the center, to prevent sun scorch of the plant.

**HARVEST:** harvest it when the head is firm and the desired size.
